

Foreword

How Forecasts Are Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are termed reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

For More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. Because of the limited space, snow survey measurements are not published in monthly reports. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

STATE	ADDRESS
Alaska	201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687
Arizona	201 East Indianola, Suite 200, Phoenix, AZ 85012
Colorado (New Mexico)	2490 West 26th Ave., Denver, CO 80211
Idaho	304 North 8th Street, Room 345, Boise, ID 83702
Montana	10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715
Nevada	50 South Virginia Street, Third Floor, Reno, NV 89505
Oregon	1220 Southwest 3rd Ave., 16th Floor, Portland, OR 97204
Utah	4402 Federal Building, 125 South State Street, Salt Lake City, UT 84147
Washington	360 U.S. Court House, Spokane, WA 99201
Wyoming	Federal Building, 100 East "B" Street, Casper, WY 82602

In addition to state reports, a Water Supply Outlook for the Western United States is published by the Soil Conservation Service and National Weather Service monthly, January through May. Reports may be obtained from the Soil Conservation Service, West National Technical Center, 511 Northwest Broadway, Room 547, Portland, OR 97209.

GENERAL OUTLOOK

SUMMARY:

Record precipitation in areas of northern Utah produced record snowpack on some snow courses and flooding on the Bear and Weber Rivers. Preliminary estimates indicated the Weber at Gateway had set a new record peak flow. The situation in southern Utah is just opposite. Shallow snowpack, warm temperatures, early runoff and half-full reservoirs could lead to rationing.

SNOWPACK:

Snowpack across the state varies from record amounts in the north to no snow on some courses in the south. Rain on snow and warm temperatures have been responsible for some snow losses at lower elevations which resulted in flooding on the Bear and Weber and their tributaries. Areas of below to much below average snowpack exist in the Oquirrh Mountains, Blue Mountain, Upper Sevier and extreme southwestern corner of the state. Snowpack now ranges from 73% in the southwest to 150% of the March 1 average in the Uintas.

PRECIPITATION:

Precipitation at mountain stations for February was received in record amounts at some locations. Rainfall in excess of 15 inches was measured at several stations with Ben Lomond Peak, northeast of Ogden, receiving 25 inches. Mountain precipitation was above average across the state during February although southern Utah received much less than the north. Accumulations for the water year are above average across the state ranging from the southwest to 161% on the Weber-Ogden drainage.

RESERVOIRS:

Useable water stored in 28 of the reservoirs in the state as of the 138% of average and 79% of useable capacity. These reservoirs are only holding cumulative capacity. The only arid reservoirs are not expected to fill until the Valley-Bull Valley Mountain area where the snowmelt runoff peak is already occurred and releases for irrigation already begun.

STREAMFLOW:

Streamflow forecasts have generally increased by 20 to 40% from the levels forecast a month ago due to heavy precipitation. The exceptions are in western and southern Utah where decreases of as much as 26% are projected. Warm weather during the last week of February and first week of March has melted a substantial amount of low and mid-elevation snow producing high early flows of water that would normally be stored in the snowpack for approximately another month.

Precipitation* (percent of normal)

*Based on selected stations

Monthly precipitation  Year to date precipitation 

WATER SUPPLY OUTLOOK:

Extremely heavy precipitation during February resulted in a dramatic increase in snowpack. Snowpack on the Bear River drainage is 147% of the March 1 average. Logan River snowpack is also 147% of the norm. Streamflow forecasts now range from 128 to 201% of average. Precipitation at mountain stations averaged 338% of average across the basin during February. Water year total accumulation is 161% of average. Reservoir storage as of the end of February was 112% of average.

WATER SUPPLY OUTLOOK:

Several snow courses in the Weber River watershed have record March 1 snowpack as a result of record February precipitation. Snowpack on the Ogden River watershed is 143% of average and the Weber drainage is 144%. Streamflow forecasts now range from 128 to 194% of average for the upcoming April-June forecast period. Precipitation at mountain stations was nearly three times normal for February with amounts ranging to 25 inches recorded. Reservoir storage is 81% of capacity and 133% of average.

Mountain snowpack* (inches)

*Based on selected stations

Maximum  Average 
Minimum  Current 

Precipitation* (percent of normal)

*Based on selected stations

Monthly precipitation  Year to date precipitation 

WATER SUPPLY OUTLOOK:

Snowpack on the Jordan River watershed has increased substantially from that of a month ago as a result of heavy precipitation and now stands at 122% of average. Tooele Valley watersheds, however, decreased by 26% and are now only 89% of average due to warm temperatures and below average rainfall. Streamflow forecasts now range from 90 to 110% of average. Mountain precipitation was 260% of average for the water year. Provo River-Utah Lake watershed in February for the water year. Reservoirs are 153% of average.

Utah Snowpack Progress

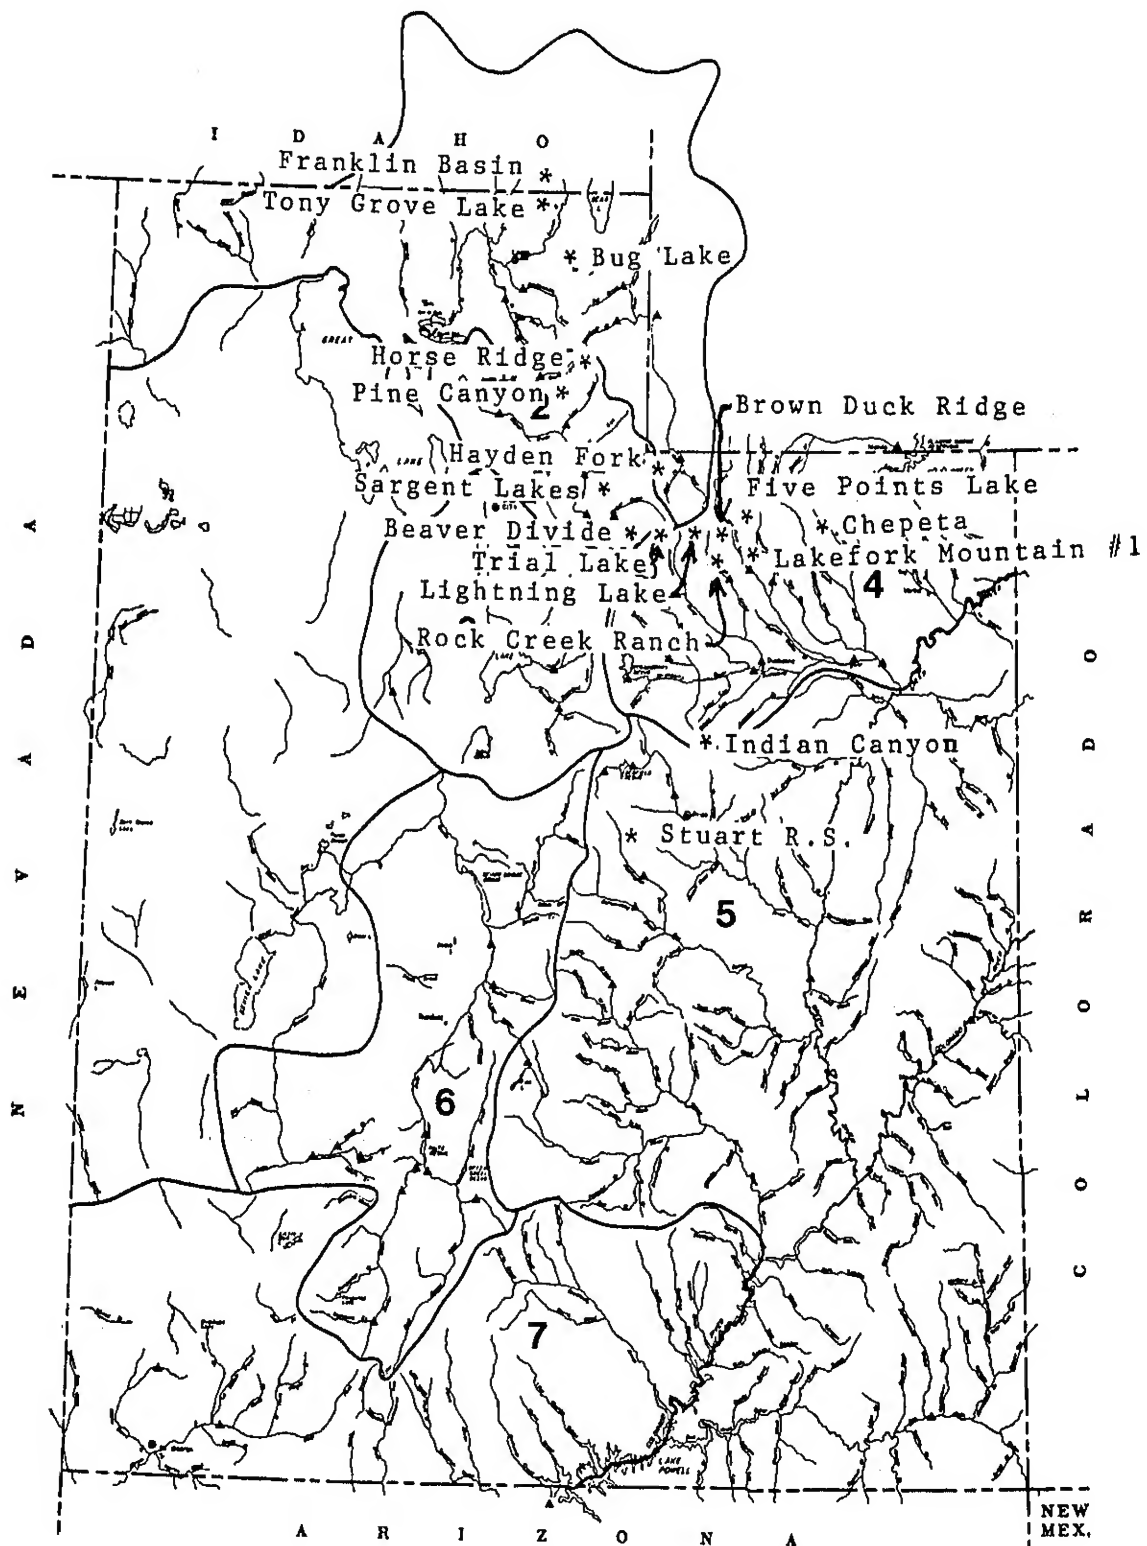

Statewide

Snow water equivalent in inches is compared to maximum seasonal amounts at 100 %.

Monthly S.W.E. averages for each course in the state are accumulated and averaged by month

*=NEW RECORD MARCH 1 SNOW WATER EQUIVALENT

The Following Organizations Cooperate With The Soil Conservation Service In Snow Survey Work

State

Utah State University
Utah State Department of Natural Resources
Division of Wildlife Resources
